

PPM: Spatial Ability (S1) Test

Name: Sample Tester Date: 11/17/11
Admin ID: UAT_jginsburg Tester ID: sampletester

The PPM Spatial Ability test involves the fundamental principle of rotating and turning over shapes in the 'mind's eye'. The problems are presented two-dimensionally so that the test taker has to be able to 'see' from the other side of the object or pattern. This is an essential ability whenever there is a need to visualise in three dimensions. It is a practical task, but the intellectual element required in rotating a number of hypotheses in order to form a single concept is also required.

The test taker had a raw score of 3 of a possible 26 points, and answered 26 of 26 questions.

The table below shows the percentile ranking for this score compared to three different comparison groups.

General Population	Working Population	Professional Manager
60%ile	40%ile	1%ile

* The results from this assessment should never be used in isolation to make selection decisions.
